

Documentation of the entire project.

Project Name: Blockchain voting system **URL:**

<https://projectcatalyst.io/funds/11/cardano-use-cases-concept/blockchain-voting-system> **Project Number:** 1100039 **Project Leads:** David Tacuri

Architectural Design: The architectural design details the general structure of our solution, including the main components and their interactions. This document is essential for understanding how the different elements of our system are integrated and how scalability, security, and performance are ensured.

Blockchain Component Design: This document describes in detail the specific components of the blockchain technology that we use in our solution. From smart contracts to network nodes, this component design provides a deep understanding of how blockchain technology is implemented in our project.

Database Schema: It provides a visual representation of the structure of our database, including tables, relationships, and key attributes. This document is fundamental for understanding how information is stored and accessed in our electoral platform.

Component Diagram: The component diagram illustrates the interaction between the different elements of our system, including the user interface components, business logic, and the data layer. This diagram provides a general overview of the architecture of our project.

Data Dictionary: It offers a detailed list of all the data elements used in our solution, along with their definitions and associated attributes. This document is useful for ensuring coherence and a common understanding of the data throughout the entire project.
